Customer Engagement & Product Utilization Analytics for Retention Strategy

Executive Summary & Research Paper

Prepared By: Sorathiya om

Data Analyst Intern

Abstract

Customer retention has become one of the most important priorities for modern businesses, especially in competitive banking and financial service industries. Acquiring new customers requires higher marketing and operational costs, while retaining existing customers improves long-term profitability, customer loyalty, and brand stability. This research paper focuses on analyzing customer engagement and product utilization behavior to identify patterns responsible for customer churn.

The project uses customer demographic, banking behavior, product usage, and engagement-related data to evaluate the major factors influencing customer retention and customer exits. The analysis was conducted using Excel for data preparation and Tableau for data visualization and dashboard development.

The dashboard highlights major churn indicators including geography, age group, active membership status, credit card ownership, balance groups, and product usage behavior. Key Performance Indicators (KPIs) such as total customers, retained customers, churned customers, and churn rate were developed to provide business-level insights.

The findings reveal that inactive customers, middle-balance customers, and certain age groups show higher churn tendencies. The analysis also indicates that customer engagement and product utilization strongly influence retention performance. Based on these insights, strategic recommendations were proposed to improve customer loyalty, reduce churn, and enhance customer experience.

RESEARCH PAPER:

1. Introduction

Customer retention is a critical success factor for banks and financial institutions. In highly competitive financial markets, customers frequently switch service providers due to dissatisfaction, lack of engagement, poor service quality, or better alternatives available in the market. Therefore, organizations must continuously monitor customer behavior and identify factors contributing to churn.

This project focuses on Customer Engagement and Product Utilization Analytics for Retention Strategy. The purpose of this study is to analyze customer-related behavioral data and identify patterns associated with customer exits and retention.

The project aims to provide meaningful business insights through data visualization and analytical techniques. By analyzing customer activity, product usage, balance levels, geography, age distribution, and membership behavior, organizations can better understand customer needs and design retention-focused strategies.

The study also demonstrates the practical application of Business Intelligence tools such as Tableau in creating interactive dashboards for real-time decision-making.

---

2. Problem Statement

Customer churn directly affects the profitability and operational stability of financial institutions. Losing customers not only reduces revenue but also increases customer acquisition costs.

Many organizations face challenges such as:

- Lack of understanding of customer behavior patterns
- Inability to identify high-risk churn groups

- Weak customer engagement strategies
- Poor monitoring of customer utilization trends
- Limited data-driven decision-making systems

Without proper analytical systems, businesses often react to churn after customers have already left. Therefore, there is a need for a centralized analytical approach that can identify churn indicators early and support proactive customer retention strategies.

This project addresses these challenges by developing a dashboard-based analytical system that evaluates customer engagement and product utilization patterns influencing customer retention.

---

3. Objectives of the Study

Primary Objectives

- To analyze customer churn patterns using customer demographic and behavioral data
- To identify factors influencing customer retention and customer exits
- To evaluate customer engagement and product utilization trends
- To develop an interactive Tableau dashboard for business insights
- To calculate and visualize customer churn rate and retention performance

Secondary Objectives

- To support data-driven customer retention strategies
- To improve business understanding of customer segmentation
- To identify high-risk customer groups
- To enhance visualization and dashboard reporting techniques
- To improve business decision-making using analytics

---

4. Dataset Description

The dataset contains customer-level information related to demographics, banking activity, and engagement behavior. The data was used to evaluate retention and churn patterns.

Major Dataset Variables

Variable	Description
Customer ID	Unique identifier for each customer
Geography	Customer location or country
Gender	Male or Female customer
Age	Customer age
Balance	Account balance maintained by customer
Number of Products	Total banking products used
Has Credit Card	Credit card ownership status
Active Member	Customer activity status
Exited	Customer churn status

Dataset Characteristics

- Total Customers: 10,000
- Retained Customers: 7,963
- Churned Customers: 2,037
- Overall Churn Rate: 20.37%

The dataset was cleaned and transformed before analysis to ensure consistency, accuracy, and proper visualization.

---

5. Methodology

The project followed a structured analytical methodology consisting of data preparation, exploratory analysis, dashboard development, and insight generation.

Step 1: Data Collection

The customer dataset containing demographic and banking information was collected and imported into Excel and Tableau.

Step 2: Data Cleaning

The following preprocessing activities were performed:

- Removal of unnecessary fields
- Data formatting and validation
- Handling categorical values
- Grouping balance and age categories
- Verifying customer status indicators

Step 3: Data Transformation

Additional calculated fields and KPIs were created including:

- Churn Rate
- Retained Customers
- Churned Customers
- Balance Groups
- Age Groups

Step 4: Exploratory Data Analysis (EDA)

EDA was performed using Tableau visualizations to identify trends and behavioral patterns.

Step 5: Dashboard Development

Interactive dashboards were created using:

- KPI Cards
- Stacked Bar Charts
- Comparative Analysis Charts
- Customer Segmentation Visualizations
- Filters for Geography and Gender

Step 6: Business Insight Generation

Insights were extracted from charts and KPIs to understand customer behavior and recommend retention strategies.

---

6. Dashboard Overview

The Tableau dashboard was designed to provide an interactive and visually structured analysis of customer churn and retention behavior.

Dashboard Components

KPI Section

The KPI section provides a quick overview of customer retention performance:

KPI	Value
Total Customers	10,000
Retained Customers	7,963
Churned Customers	2,037
Churn Rate	20.37%

Dashboard Visualizations

The dashboard includes the following analytical charts:

- Churn by Geography
- Churn by Number of Products
- Churn by Age Group
- Churn by Balance Group
- Churn by Active Member Status
- Churn by Gender
- Churn by Credit Card Status

Interactive Features

The dashboard includes interactive filters:

- Geography Filter
- Gender Filter

These filters allow users to dynamically analyze customer segments and churn behavior.

---

7. Key Findings and Insights

7.1 Customer Churn Rate

The analysis revealed an overall churn rate of 20.37%, indicating that approximately one out of every five customers exited the bank.

This highlights the importance of implementing stronger retention strategies and improving customer engagement.

7.2 Geography-Based Churn Analysis

The geographical analysis showed differences in customer retention behavior across regions.

Key observations include:

- France had the highest retained customer count.
- Germany showed comparatively higher churn contribution.
- Customer behavior patterns varied significantly across locations.

This suggests that regional business strategies may be necessary for improving retention performance.

7.3 Age-Group Analysis

Customer churn varied across age groups.

Key observations:

- Customers aged 30–45 formed the largest customer segment.
- Middle-aged customers showed higher retention rates.
- Older customer groups displayed comparatively lower engagement.

This indicates that age-based personalization and targeted customer programs can improve retention.

7.4 Product Utilization Analysis

The analysis of product usage revealed that customer engagement increases with product adoption.

Key observations:

- Customers using multiple products demonstrated stronger engagement.
- Product utilization patterns directly influenced retention performance.
- Customers with limited product usage showed higher churn tendencies.

This highlights the importance of cross-selling and product engagement strategies.

7.5 Active Membership Analysis

Active membership status showed a strong relationship with retention.

Key observations:

- Active members demonstrated significantly higher retention.
- Inactive members contributed heavily to churn.
- Customer engagement directly impacts loyalty and retention behavior.

Improving customer activity levels can substantially reduce churn.

7.6 Balance Group Analysis

Balance-based segmentation showed noticeable churn variations.

Key observations:

- Medium-balance customers formed a major customer group.
- High-balance customers represented valuable customer segments.
- Low-balance groups displayed lower overall customer engagement.

Financial institutions should prioritize retention strategies for high-value customers.

7.7 Gender-Based Analysis

The dashboard revealed moderate variation between male and female customer segments.

Key observations:

- Male customers formed a slightly larger customer segment.
- Both genders demonstrated retention dominance over churn.
- Churn percentages varied slightly across gender categories.

This suggests that gender alone is not the strongest churn indicator but may contribute when combined with other behavioral factors.

8. Business Recommendations

Based on the analytical findings, the following recommendations are proposed:

8.1 Improve Customer Engagement Programs

Organizations should increase engagement activities for inactive customers through:

- Personalized communication
- Loyalty programs
- Promotional offers
- Financial advisory support

8.2 Strengthen Product Utilization Strategies

Customers using fewer products should be encouraged to adopt additional banking services through:

- Product bundling
- Cross-selling campaigns
- Personalized recommendations

8.3 Develop Region-Specific Strategies

Different regions display different churn patterns. Therefore, location-based strategies should be implemented to address customer needs effectively

8.4 Focus on High-Risk Customer Segments

Customers showing higher churn tendencies should be monitored continuously using predictive analytics and engagement tracking.

8.5 Enhance Dashboard Monitoring Systems

Businesses should integrate interactive dashboards into regular decision-making processes for real-time customer monitoring and strategic planning.

---

9. Limitations of the Study

Although the project provides valuable insights, certain limitations exist:

- The analysis is limited to the available dataset.
- External market and economic factors were not included.
- Real-time customer transaction behavior was not analyzed.
- Predictive machine learning models were not implemented.

Future studies can improve the analysis using larger datasets and advanced predictive techniques.

---

10. Conclusion

This project successfully analyzed customer engagement and product utilization behavior to understand customer retention and churn patterns.

Using Tableau dashboards and data analytics techniques, the study identified key factors influencing customer exits including active membership status, balance groups, age categories, geography, and product usage behavior.

The dashboard-based approach improved visualization, business understanding, and customer segmentation analysis. The findings demonstrate that customer engagement and product utilization play a critical role in retention performance.

The project also highlights the importance of Business Intelligence tools in transforming raw customer data into actionable insights for strategic decision-making.

Overall, the study provides a strong analytical foundation for improving customer retention strategies and reducing churn in banking and financial institutions.

Appendix

Tools Used

Tool	Purpose
Microsoft Excel	Data Cleaning and Preparation
Tableau	Dashboard Development and Visualization

Dashboard Features

- Interactive KPI Cards
- Dynamic Filters
- Comparative Churn Analysis
- Customer Segmentation
- Retention Performance Monitoring
